The one-time, five-minute procedure for heavy menstrual bleeding

NovaSure ADVANCED
Endometrial Ablation
NovaSure endometrial ablation (EA) is the simple, one-time, five-minute procedure that has been used to treat over 2.5 million women—without hormones or hysterectomy.

The NovaSure procedure is for premenopausal women with heavy periods due to benign causes who are finished childbearing. Pregnancy following the NovaSure procedure can be dangerous.

NovaSure endometrial ablation is not for those who have or suspect uterine cancer; have an active genital, urinary or pelvic infection or an IUD. Rare but serious risks include thermal injury, perforation, infection and other problems. Temporary side effects may include cramping, nausea, vomiting, discharge and spotting.

Talk to your doctor for more information. NovaSure endometrial ablation is not a sterilization procedure and not for women who may be pregnant.

This brochure contains information about heavy menstrual bleeding, as well as treatment options, including the NovaSure procedure.
Do heavy periods affect your life?

It’s estimated that heavy menstrual bleeding affects 1 out of every 5 women—that’s about 10 million women!1 Many women begin to experience heavy and/or irregular bleeding in their 30s and 40s, as they begin to get closer to menopause. Heavy periods take a physical, social, and emotional toll as well.

Studies show heavy periods mean more than heavy bleeding. They can affect women in numerous ways:

### Physical:
- Many feel tired and nauseated.
- Many experience bad cramps.
- Many have headaches.

### Social:
- More than 60% have had to miss social or athletic events.3
- About 80% report avoiding sex.2
- 33% have been forced to miss work.3

### Emotional:
- 77% have depression or moodiness.2
- 75% feel anxious.3
- 57% report a lack of confidence during their period.3

What is NovaSure endometrial ablation?

NovaSure endometrial ablation is a one-time, five-minute procedure that can lighten or end your heavy periods. No pills. No hormonal side effects. For 91% of women, menstrual bleeding is dramatically reduced or stopped.3 It’s a simple procedure that can be done in your doctor’s office.

The benefits of the NovaSure procedure:

- One-time procedure.4
- The procedure is quick—it usually takes less than five minutes.4
- It can be performed in a doctor’s office with no general anesthesia.4
- 91% of women returned to normal or light periods, or had no periods at all.3
- 41% reported that their periods stopped completely.3
- 97% of patients from the initial clinical trial experienced no post-procedural pain.4
- There are no incisions (cuts into your body).
- It can be performed at any time during your cycle, even if you’re bleeding.4
- You don’t need to prepare by taking any pre-treatment medicine.4
Choosing the right treatment for you.

There are several treatment options available. The chart below highlights the advantages and disadvantages of the most common options. Your doctor can help you decide which treatment may be right for you.

How does the NovaSure procedure work?

The NovaSure endometrial ablation (EA) procedure can reduce or stop menstrual bleeding. It works by permanently removing the endometrium, or the lining of the uterus (the part that causes the bleeding), with a quick delivery of radiofrequency energy.

The NovaSure Procedure

Your doctor opens your cervix (the opening to the uterus) slightly, inserts a slender wand and extends a triangular-shaped netted device into the uterus.

The netting expands, fitting to the size and shape of your uterus.

Precisely measured radiofrequency energy is delivered through the netting for about 90 seconds.

The netted device is pulled back into the wand, and both are removed from the uterus.

No part of the NovaSure device remains inside your body after the procedure.

Are women satisfied with the NovaSure procedure?

In a clinical study, 12 months after the NovaSure procedure:

- 93% of patients were satisfied with the results.
- 97% said they would recommend the procedure to a friend.

Nearly 7 out of every 10 endometrial ablations performed are the NovaSure procedure.
What can I expect?

Most women who have had the NovaSure procedure have lighter periods or no periods afterwards. In a clinical study, 9 out of 10 women returned to normal or light periods and 4 out of 10 stopped bleeding altogether.³

...and more

Many women who’ve had the NovaSure procedure say they are now able to spend more time at work and daily activities, and miss out on fewer social and athletic outings because of heavy periods. They also report improved energy levels, better moods and a boost in self-confidence. And many also had a significant reduction in painful periods and PMS symptoms like irritability.³
It could even come and go, increasing after certain activities. This is quite normal and can be expected with any endometrial ablation procedure.

**Are there any risks I should know about?**
Your doctor will explain the risks of all treatment options. Some of the risks associated with the NovaSure endometrial ablation procedure are perforation of the uterus, bleeding, infection, abnormally slow heart beat, injury to organs within the abdomen or around the uterus or complications leading to serious injury or death. These problems are very rare and reported at a rate of less than 0.01%.

Tell your doctor if you have a cardiac pacemaker or any other electrical device in your body.

Very few patients experience complications following the NovaSure procedure. But you should call your doctor right away if you develop:

- A fever higher than 100.4°F.
- Worsening pelvic pain that is not relieved by ibuprofen or other prescribed medicine.
- Nausea, vomiting, shortness of breath, dizziness.
- Bowel or bladder problems.
- A greenish vaginal discharge (reddish, yellowish or brownish is normal).

**Can I still become pregnant after the NovaSure procedure?**
Because NovaSure endometrial ablation treats the lining of the uterus, your chances of getting pregnant after the procedure will be reduced. However, it is still possible to get pregnant if you’re sexually active. A pregnancy after an ablation is very dangerous for both the mother and the fetus, since the uterine lining would not be able to properly support fetal development. It’s very important to talk to your doctor about what birth control you will use after the NovaSure procedure.

**What can I expect after the NovaSure procedure?**
Immediately after the NovaSure procedure, some women experience some cramping, mild pain, nausea and/or vomiting. Most women feel back to themselves and can resume normal activities within a day or so. Be sure to follow any instructions from your doctor, no matter how good you’re feeling.

A watery and/or bloody discharge following the NovaSure procedure is normal. It could start anywhere from immediately after the procedure to a couple of weeks afterwards. The discharge may last only briefly, or for up to a couple of months.

Every woman is different. But plan to give your body about 3 months to fully heal on the inside and resume its normal cycle. Then, you and your doctor should be able to tell what your cycle and your periods will be like from that point on.
Talking to your doctor about heavy menstrual bleeding

Research has shown that many women who suffer from heavy periods do not bring the subject up with their doctors or seek treatment. Major

Heavy periods are a problem that affects 1 out of every 5 women.

If getting the conversation started seems hard once you’re at your doctor’s office, try one of these openers:

• “I’d like to ask you a few questions about my menstrual cycle…”
• “I’ve noticed that my periods are different than they used to be…”
• “I’ve heard that a lot of women are getting treated for heavy periods—is this something I should consider?”

If you suffer from heavy menstrual bleeding and do not wish to have any children in the future, be sure to ask your doctor if NovaSure endometrial ablation may be right for you.

Heavy menstrual bleeding checklist

Do any of the following statements apply to you?

☐ My period affects my quality of life.
☐ I am bothered by the amount of bleeding or level of pain I have during my periods.
☐ My period makes me feel depressed, tired or moody.
☐ I am afraid of having an embarrassing accident.
☐ I have PMS symptoms, such as headaches, during my period.
☐ I bleed more than once a month.
☐ My period lasts too long.
☐ My period affects my social, athletic or sexual activities or causes me to miss work.
☐ My life would improve if I could decrease or completely eliminate my period.
☐ I would like to learn about a simple procedure that can help me get back to living.

Use the space below to write down any additional questions or concerns:
